

# MAKE WAY

ENVIRONMENTAL TECHNOLOGIES INC.

---

Bacteria in wastewater need oxygen. Some systems depend on a mechanical aerator that consumes energy (electricity) to introduce dissolved oxygen into their systems. The System O)) however, is a passive system that does not require any mechanical or electrical components to treat the sewage. The system uses the passage of air within the Advanced Enviro-Septic Pipe to ensure optimal functioning, unequalled durability and worry-free performance.

For this reason, System O)) must be properly ventilated from the entry vent at the far end of the system, through the Advanced Enviro-Septic pipes, the distribution box and the septic tank to finish through the exit vent, which is the plumbing stack already located on the roof of the house. This allows for the passive movement of air to constantly move through the system without the need of mechanical or electrical components. However, this extremely important feature of System O)) does not need to be an eyesore or a negative deciding factor for the homeowner. There are many ways to hide, camouflage or disguise the ventilation pipe without hindering the system.

---

The vent pipe does not need to sit in the middle of the System O)) bed. It can be located at the back of the bed, furthest away from the house. It can be tucked into the tree line or bushes, in the middle of a flower bed, or beside a planted shrub. Some homeowners even use a bird bath to hide the vent or place it under a faux rock (with perforations). There is also a green mushroom type cap available.
